September 17, 2024

Title Non-Parametric Causal Effects of Feasible Interventions Based on Modified Treatment Policies

Version 1.4.2

Description Non-parametric estimators for casual effects based on longitudinal modified treatment policies as described in Diaz, Williams, Hoffman, and Schenck <doi:10.1080/01621459.2021.1955691>, traditional point treatment, and traditional longitudinal effects. Continuous, binary, categorical treatments, and multivariate treatments are allowed as well are censored outcomes. The treatment mechanism is estimated via a density ratio classification procedure irrespective of treatment variable type. For both continuous

and binary outcomes, additive treatment effects can be calculated and relative risks and odds ratios may be calculated for binary outcomes.

### Index

create\_node\_list Create a node list specification

### Description

Creates a node list specification that is used by the provided estimators. create\_node\_list() is not explicitly called by the analyst, rather it is provided so the analyst can confirm how estimators will use variables before actually performing the estimation procedure.

### Usage

```
create_node_list(trt, tau, time_vary = NULL, baseline = NULL, k = Inf)
```

### Arguments

trt	A vector of column names of treatment variables.
tau	The number of time points of observation, excluding the final outcome.
time_vary	A list of length tau with the column names for new time_vary to be introduced at each time point. The list should be ordered following the time ordering of the model.
baseline	An optional vector of columns names for baseline covariates to be included for adjustment at every timepoint.
k	An integer specifying how previous time points should be used for estimation at the given time point. Default is Inf, all time points.

### event\_locf

### Value

A list of lists. Each sub-list is the same length of the time\_vary parameter with the variables to be used for estimation at that given time point for either the treatment mechanism or outcome regression.

### Examples

```
a <- c("A_1", "A_2", "A_3", "A_4")
bs <- c("W_1", "W_2")
time_vary <- list(c("L_1"), c("L_2"), c("L_3"), c("L_4"))
# assuming no Markov property
create_node_list(a, 4, time_vary, bs, k = Inf)
# assuming a Markov property
create_node_list(a, 4, time_vary, bs, k = 0)
```

event\_locf

### Time To Event Last Outcome Carried Forward

### Description

A helper function to prepare survival data for use with LMTP estimators by imputing outcome nodes using last outcome carried forward when an observation experiences the event before the end-of-follow-up.

#### Usage

```
event_locf(data, outcomes)
```

#### Arguments

data	The dataset to modify.
outcomes	A vector of outcome nodes ordered by time.

### Value

A modified dataset with future outcome nodes set to 1 if an observation experienced an event at any previous time point.

### Examples

event\_locf(sim\_point\_surv, paste0("Y.", 1:6))

ipsi

### Description

A function factory that returns a shift function for increasing or decreasing the probability of exposure when exposure is binary.

### Usage

ipsi(delta)

#### Arguments

delta [numeric(1)] A risk ratio between 0 and Inf.

### Value

A shift function.

### See Also

lmtp\_tmle(), lmtp\_sdr(), lmtp\_sub(), lmtp\_ipw()

### Examples

lmtp\_contrast Perform Contrasts of LMTP Fits

### Description

Estimates contrasts of multiple LMTP fits compared to either a known reference value or a reference LMTP fit.

#### Usage

```
lmtp_contrast(..., ref, type = c("additive", "rr", "or"))
```

### lmtp\_contrast

#### Arguments

	One or more objects of class lmtp.
ref	A reference value or another lmtp fit to compare all other fits against.
type	The contrasts of interest. Options are "additive" (the default), "rr", and "or".

### Value

A list of class lmtp\_contrast containing the following components:

type	The type of contrast performed.
null	The null hypothesis.
vals	A dataframe containing the contrasts estimates, standard errors, and confidence intervals.
eifs	Un-centered estimated influence functions for contrasts estimated.

```
a <- c("A1", "A2")
nodes <- list(c("L1"), c("L2"))</pre>
cens <- c("C1", "C2")
y <- "Y"
# mean population outcome
psi_null <- lmtp_tmle(sim_cens, a, y, time_vary = nodes, cens = cens, shift = NULL, folds = 1)</pre>
# treatment rule, everyone is increased by 0.5
d <- function(data, x) data[[x]] + 0.5</pre>
psi_rule1 <- lmtp_tmle(sim_cens, a, y, time_vary = nodes, cens = cens,</pre>
                        shift = d, folds = 1, mtp = TRUE)
# treatment rule, everyone is decreased by 0.5
d <- function(data, x) data[[x]] - 0.5</pre>
psi_rule2 <- lmtp_tmle(sim_cens, a, y, time_vary = nodes, cens = cens,</pre>
                        shift = d, folds = 1, mtp = TRUE)
# Example 1.1
# Additive effect of rule 1 compared to a known constant
lmtp_contrast(psi_rule1, ref = 0.9)
# Example 1.2
# Additive effect of rule 1 compared to the population mean outcome
lmtp_contrast(psi_rule1, ref = psi_null)
# Example 1.3
# Additive effects of rule 1 and 2 compared to the population mean outcome
lmtp_contrast(psi_rule1, psi_rule2, ref = psi_null)
# Example 1.4
# Relative risk of rule 1 compared to observed exposure
lmtp_contrast(psi_rule1, ref = psi_null, type = "rr")
```

```
# Example 1.5
# Odds of rule 1 compared to observed exposure
lmtp_contrast(psi_rule1, ref = psi_null, type = "or")
```

 lmtp\_control
 Set LMTP Estimation Parameters

### Description

Set LMTP Estimation Parameters

### Usage

```
lmtp_control(
  .bound = 1e+05,
  .trim = 0.999,
  .learners_outcome_folds = 10,
  .learners_trt_folds = 10,
  .return_full_fits = FALSE,
  .B = 1000,
  .boot_seed = NULL
)
```

### Arguments

. bound	[numeric(1)] Determines that maximum and minimum values (scaled) predictions will be bounded by. The default is 1e-5, bounding predictions by 1e-5 and 0.9999.	
.trim	[numeric(1)] Determines the amount the density ratios should be trimmed. The default is 0.999, trimming the density ratios greater than the 0.999 percentile to the 0.999 percentile. A value of 1 indicates no trimming.	
.learners_outcome_folds		
	[integer(1)]	
	The number of cross-validation folds for learners_outcome.	
.learners_trt_folds		
	[integer(1)]	
	The number of cross-validation folds for learners_trt.	
.return_full_fits		
	[logical(1)] Return full SuperLearner fits? Default is FALSE, return only SuperLearner weights.	
.В	description	
.boot_seed	description	

### lmtp\_ipw

### Value

A list of parameters controlling the estimation procedure.

### Examples

lmtp\_control(.trim = 0.975)

.mtp.	
	_1pw

LMTP IPW Estimator

### Description

Inverse probability of treatment weighting estimator for the effects of traditional causal effects and modified treatment policies for both point treatment and longitudinal data with binary, continuous, or time-to-event outcomes. Supports binary, categorical, and continuous exposures.

### Usage

```
lmtp_ipw(
 data,
  trt,
 outcome,
 baseline = NULL,
  time_vary = NULL,
  cens = NULL,
  shift = NULL,
  shifted = NULL,
 mtp = FALSE,
 k = Inf,
  id = NULL,
 outcome_type = c("binomial", "continuous", "survival"),
 learners = "SL.glm",
  folds = 10,
 weights = NULL,
  control = lmtp_control()
)
```

### Arguments

data	[data.frame] A data.frame in wide format containing all necessary variables for the estima- tion problem. Must not be a data.table.
trt	<ul><li>[character] or [list]</li><li>A vector containing the column names of treatment variables ordered by time.</li><li>Or, a list of vectors, the same length as the number of time points of observation.</li><li>Vectors should contain column names for the treatment variables at each time point. The list should be ordered following the time ordering of the model.</li></ul>

outcome	[character] The column name of the outcome variable. In the case of time-to-event analysis, a vector containing the columns names of intermediate outcome variables and the final outcome variable ordered by time. Only numeric values are allowed. If the outcome type is binary, data should be coded as 0 and 1.
baseline	[character] An optional vector containing the column names of baseline covariates to be included for adjustment at every time point.
time_vary	<pre>[list] A list the same length as the number of time points of observation with the column names for new time-varying covariates introduced at each time point. The list should be ordered following the time ordering of the model.</pre>
cens	[character] An optional vector of column names of censoring indicators the same length as the number of time points of observation. If missingness in the outcome is present or if time-to-event outcome, must be provided.
shift	[closure] A two argument function that specifies how treatment variables should be shifted. See examples for how to specify shift functions for continuous, binary, and cat- egorical exposures.
shifted	[data.frame] An optional data frame, the same as in data, but modified according to the treatment policy of interest. If specified, shift is ignored.
mtp	[logical(1)] Is the intervention of interest a modified treatment policy? Default is FALSE. If treatment variables are continuous this should be TRUE.
k	[integer(1)] An integer specifying how previous time points should be used for estimation at the given time point. Default is Inf, all time points.
id	[character(1)] An optional column name containing cluster level identifiers.
outcome_type	[character(1)] Outcome variable type (i.e., continuous, binomial, survival).
learners	[character] A vector of SuperLearner algorithms for estimation of the exposure mech- anism. Default is "SL.glm", a main effects GLM. <b>Only include candidate</b> <b>learners capable of binary classification</b> .
folds	[integer(1)] The number of folds to be used for cross-fitting.
weights	[numeric(nrow(data))] An optional vector containing sampling weights.
control	<pre>[list()] Output of lmtp_control().</pre>

### lmtp\_ipw

### Details

#### **Should** mtp = TRUE**?**:

A modified treatment policy (MTP) is an intervention that depends on the natural value of the exposure (the value that the treatment would have taken under no intervention). This differs from other causal effects, such as the average treatment effect (ATE), where an exposure would be increased (or decreased) deterministically. **If your intervention of interest adds, subtracts, or multiplies the observed treatment values by some amount, use mtp = TRUE**.

#### Value

A list of class 1mtp containing the following components:

estimator	The estimator used, in this case "IPW".
theta	The estimated population LMTP effect.
standard_error	NA
low	NA
high	NA
shift	The shift function specifying the treatment policy of interest.
density_ratios	An n x Tau matrix of the estimated density ratios.
fits_r	A list the same length as folds, containing the fits at each time-point for each fold of density ratio estimation.

```
set.seed(56)

LMTP Sequential Doubly Robust Estimator

### Description

Sequentially doubly robust estimator for the effects of traditional causal effects and modified treatment policies for both point treatment and longitudinal data with binary, continuous, or time-toevent outcomes. Supports binary, categorical, and continuous exposures.

### Usage

```
lmtp_sdr(
   data,
   trt,
   outcome,
   baseline = NULL,
   time_vary = NULL,
```

### lmtp\_sdr

```
cens = NULL,
shift = NULL,
shifted = NULL,
k = Inf,
mtp = FALSE,
outcome_type = c("binomial", "continuous", "survival"),
id = NULL,
bounds = NULL,
learners_outcome = "SL.glm",
learners_trt = "SL.glm",
folds = 10,
weights = NULL,
control = lmtp_control()
```

### Arguments

)

data	[data.frame] A data.frame in wide format containing all necessary variables for the estima- tion problem. Must not be a data.table.
trt	[character] or [list] A vector containing the column names of treatment variables ordered by time. Or, a list of vectors, the same length as the number of time points of observation. Vectors should contain column names for the treatment variables at each time point. The list should be ordered following the time ordering of the model.
outcome	[character] The column name of the outcome variable. In the case of time-to-event analysis, a vector containing the columns names of intermediate outcome variables and the final outcome variable ordered by time. Only numeric values are allowed. If the outcome type is binary, data should be coded as 0 and 1.
baseline	[character] An optional vector containing the column names of baseline covariates to be included for adjustment at every time point.
time_vary	[list] A list the same length as the number of time points of observation with the column names for new time-varying covariates introduced at each time point. The list should be ordered following the time ordering of the model.
cens	[character] An optional vector of column names of censoring indicators the same length as the number of time points of observation. If missingness in the outcome is present or if time-to-event outcome, must be provided.
shift	[closure] A two argument function that specifies how treatment variables should be shifted. See examples for how to specify shift functions for continuous, binary, and cat- egorical exposures.
shifted	[data.frame] An optional data frame, the same as in data, but modified according to the

	treatment policy of interest. If specified, shift is ignored.	
k	[integer(1)] An integer specifying how previous time points should be used for estimation at the given time point. Default is Inf, all time points.	
mtp	[logical(1)] Is the intervention of interest a modified treatment policy? Default is FALSE. If treatment variables are continuous this should be TRUE.	
outcome_type	[character(1)] Outcome variable type (i.e., continuous, binomial, survival).	
id	[character(1)] An optional column name containing cluster level identifiers.	
bounds	[numeric(2)] An optional, ordered vector of the bounds for a continuous outcomes. If NULL, the bounds will be taken as the minimum and maximum of the observed data. Should be left as NULL if the outcome type is binary.	
learners_outcome		
	[character] A vector of SuperLearner algorithms for estimation of the outcome regression. Default is "SL.glm", a main effects GLM.	
learners_trt	[character] A vector of SuperLearner algorithms for estimation of the exposure mech- anism. Default is "SL.glm", a main effects GLM. <b>Only include candidate</b> <b>learners capable of binary classification</b> .	
folds	[integer(1)] The number of folds to be used for cross-fitting.	
weights	[numeric(nrow(data))] An optional vector containing sampling weights.	
control	<pre>[list()] Output of lmtp_control().</pre>	

### Details

### Should mtp = TRUE?:

A modified treatment policy (MTP) is an intervention that depends on the natural value of the exposure (the value that the treatment would have taken under no intervention). This differs from other causal effects, such as the average treatment effect (ATE), where an exposure would be increased (or decreased) deterministically. **If your intervention of interest adds, subtracts, or multiplies the observed treatment values by some amount, use mtp = TRUE**.

### Value

A list of class 1mtp containing the following components:

estimator	The estimator used, in this case "SDR".
theta	The estimated population LMTP effect.
standard_error	The estimated standard error of the LMTP effect.

low	Lower bound of the 95% confidence interval of the LMTP effect.
high	Upper bound of the 95% confidence interval of the LMTP effect.
eif	The estimated, un-centered, influence function of the estimate.
shift	The shift function specifying the treatment policy of interest.
outcome_reg	An n x Tau + 1 matrix of outcome regression predictions. The mean of the first column is used for calculating theta.
density_ratios	An n x Tau matrix of the estimated, non-cumulative, density ratios.
density_ratios fits_m	An n x Tau matrix of the estimated, non-cumulative, density ratios. A list the same length as folds, containing the fits at each time-point for each fold for the outcome regression.
5 –	A list the same length as folds, containing the fits at each time-point for each

```

lmtp\_sub

LMTP Substitution Estimator

### Description

G-computation estimator for the effects of traditional causal effects and modified treatment policies for both point treatment and longitudinal data with binary, continuous, or time-to-event outcomes. Supports binary, categorical, and continuous exposures.

#### Usage

```
lmtp_sub(
  data,
  trt,
  outcome,
  baseline = NULL,
  time_vary = NULL,
  cens = NULL,
  shift = NULL,
  shifted = NULL,
  k = Inf,
  outcome_type = c("binomial", "continuous", "survival"),
  id = NULL,
  bounds = NULL,
```

### lmtp\_sub

```
learners = "SL.glm",
folds = 10,
weights = NULL,
control = lmtp_control()
)
```

### Arguments

data	[data.frame] A data.frame in wide format containing all necessary variables for the estima- tion problem. Must not be a data.table.
trt	[character] or [list] A vector containing the column names of treatment variables ordered by time. Or, a list of vectors, the same length as the number of time points of observation. Vectors should contain column names for the treatment variables at each time point. The list should be ordered following the time ordering of the model.
outcome	[character] The column name of the outcome variable. In the case of time-to-event analysis, a vector containing the columns names of intermediate outcome variables and the final outcome variable ordered by time. Only numeric values are allowed. If the outcome type is binary, data should be coded as 0 and 1.
baseline	[character] An optional vector containing the column names of baseline covariates to be included for adjustment at every time point.
time_vary	[list] A list the same length as the number of time points of observation with the column names for new time-varying covariates introduced at each time point. The list should be ordered following the time ordering of the model.
cens	[character] An optional vector of column names of censoring indicators the same length as the number of time points of observation. If missingness in the outcome is present or if time-to-event outcome, must be provided.
shift	[closure] A two argument function that specifies how treatment variables should be shifted. See examples for how to specify shift functions for continuous, binary, and cat- egorical exposures.
shifted	[data.frame] An optional data frame, the same as in data, but modified according to the treatment policy of interest. If specified, shift is ignored.
k	[integer(1)] An integer specifying how previous time points should be used for estimation at the given time point. Default is Inf, all time points.
outcome_type	[character(1)] Outcome variable type (i.e., continuous, binomial, survival).
id	[character(1)] An optional column name containing cluster level identifiers.

bounds	[numeric(2)] An optional, ordered vector of the bounds for a continuous outcomes. If NULL, the bounds will be taken as the minimum and maximum of the observed data. Should be left as NULL if the outcome type is binary.
learners	[character] A vector of SuperLearner algorithms for estimation of the outcome regression. Default is "SL.glm", a main effects GLM.
folds	[integer(1)] The number of folds to be used for cross-fitting.
weights	[numeric(nrow(data))] An optional vector containing sampling weights.
control	<pre>[list()] Output of lmtp_control().</pre>

#### Value

A list of class 1mtp containing the following components:

estimator	The estimator used, in this case "substitution".
theta	The estimated population LMTP effect.
standard_error	NA
low	NA
high	NA
shift	The shift function specifying the treatment policy of interest.
outcome_reg	An n x Tau + 1 matrix of outcome regression predictions. The mean of the first column is used for calculating theta.
fits_m	A list the same length as folds, containing the fits at each time-point for each fold for the outcome regression.
outcome_type	The outcome variable type.

```
set.seed(56)
n <- 1000
W <- rnorm(n, 10, 5)

```

lmtp\_survivalLMTP Survival Curve Estimator

#### Description

Wrapper around lmtp\_tmle and lmtp\_sdr for survival outcomes to estimate the entire survival curve. Estimates are reconstructed using isotonic regression to enforce monotonicity of the survival curve. Confidence intervals correspond to marginal confidence intervals for the survival curve, not simultaneous intervals.

### Usage

```
lmtp_survival(
  data,
  trt,
 outcomes,
 baseline = NULL,
 time_vary = NULL,
  cens = NULL,
  shift = NULL,
 shifted = NULL,
 estimator = c("lmtp_tmle", "lmtp_sdr"),
  k = Inf,
 mtp = FALSE,
 boot = FALSE,
  id = NULL,
  learners_outcome = "SL.glm",
  learners_trt = "SL.glm",
  folds = 10,
 weights = NULL,
 control = lmtp_control()
)
```

### Arguments

data	[data.frame] A data.frame in wide format containing all necessary variables for the estima- tion problem. Must not be a data.table.
trt	[character] or [list] A vector containing the column names of treatment variables ordered by time. Or, a list of vectors, the same length as the number of time points of observation. Vectors should contain column names for the treatment variables at each time point. The list should be ordered following the time ordering of the model.
outcomes	[character] A vector containing the columns names of intermediate outcome variables and the final outcome variable ordered by time. Only numeric values are allowed. Variables should be coded as 0 and 1.
baseline	[character] An optional vector containing the column names of baseline covariates to be included for adjustment at every time point.
time_vary	[list] A list the same length as the number of time points of observation with the column names for new time-varying covariates introduced at each time point. The list should be ordered following the time ordering of the model.
cens	[character] An optional vector of column names of censoring indicators the same length as the number of time points of observation. If missingness in the outcome is present or if time-to-event outcome, must be provided.

shift	[closure] A two argument function that specifies how treatment variables should be shifted. See examples for how to specify shift functions for continuous, binary, and cat- egorical exposures.	
shifted	[data.frame] An optional data frame, the same as in data, but modified according to the treatment policy of interest. If specified, shift is ignored.	
estimator	<pre>[character(1)] The estimator to use. Either "lmtp_tmle" or "lmtp_sdr".</pre>	
k	[integer(1)] An integer specifying how previous time points should be used for estimation at the given time point. Default is Inf, all time points.	
mtp	[logical(1)] Is the intervention of interest a modified treatment policy? Default is FALSE. If treatment variables are continuous this should be TRUE.	
boot	[logical(1)] Compute standard errors using the bootstrap? Default is FALSE. If FALSE, stan- dard errors will be calculated using the empirical variance of the efficient influ- ence function. Ignored if estimator = "lmtp_sdr".	
id	[character(1)] An optional column name containing cluster level identifiers.	
learners_outcom	ne	
	[character] A vector of SuperLearner algorithms for estimation of the outcome regression. Default is "SL.glm", a main effects GLM.	
learners_trt	[character] A vector of SuperLearner algorithms for estimation of the exposure mech- anism. Default is "SL.glm", a main effects GLM. <b>Only include candidate</b> <b>learners capable of binary classification</b> .	
folds	[integer(1)] The number of folds to be used for cross-fitting.	
weights	[numeric(nrow(data))] An optional vector containing sampling weights.	
control	<pre>[list()] Output of lmtp_control().</pre>	

### Value

A list of class lmtp\_survival containing lmtp objects for each time point.

```
# Time-to-event analysis with a binary time-invariant exposure. Interested in
# the effect of treatment being given to all observations on the cumulative
# incidence of the outcome.
```

```
A <- "trt"
```

lmtp\_tmle

LMTP Targeted Maximum Likelihood Estimator

### Description

Targeted maximum likelihood estimator for the effects of traditional causal effects and modified treatment policies for both point treatment and longitudinal data with binary, continuous, or time-to-event outcomes. Supports binary, categorical, and continuous exposures.

### Usage

```
lmtp_tmle(
  data,
  trt,
  outcome,
  baseline = NULL,
  time_vary = NULL,
  cens = NULL,
  shift = NULL,
  shifted = NULL,
  k = Inf,
 mtp = FALSE,
  boot = FALSE,
  outcome_type = c("binomial", "continuous", "survival"),
  id = NULL,
  bounds = NULL,
  learners_outcome = "SL.glm",
  learners_trt = "SL.glm",
  folds = 10,
 weights = NULL,
  control = lmtp_control()
)
```

### Arguments

data

[data.frame] A data.frame in wide format containing all necessary variables for the estimation problem. Must not be a data.table.

trt	[character] or [list] A vector containing the column names of treatment variables ordered by time. Or, a list of vectors, the same length as the number of time points of observation. Vectors should contain column names for the treatment variables at each time point. The list should be ordered following the time ordering of the model.
outcome	[character] The column name of the outcome variable. In the case of time-to-event analysis, a vector containing the columns names of intermediate outcome variables and the final outcome variable ordered by time. Only numeric values are allowed. If the outcome type is binary, data should be coded as 0 and 1.
baseline	[character] An optional vector containing the column names of baseline covariates to be included for adjustment at every time point.
time_vary	[list] A list the same length as the number of time points of observation with the column names for new time-varying covariates introduced at each time point. The list should be ordered following the time ordering of the model.
cens	[character] An optional vector of column names of censoring indicators the same length as the number of time points of observation. If missingness in the outcome is present or if time-to-event outcome, must be provided.
shift	[closure] A two argument function that specifies how treatment variables should be shifted. See examples for how to specify shift functions for continuous, binary, and cat- egorical exposures.
shifted	[data.frame] An optional data frame, the same as in data, but modified according to the treatment policy of interest. If specified, shift is ignored.
k	[integer(1)] An integer specifying how previous time points should be used for estimation at the given time point. Default is Inf, all time points.
mtp	[logical(1)] Is the intervention of interest a modified treatment policy? Default is FALSE. If treatment variables are continuous this should be TRUE.
boot	[logical(1)] Compute standard errors using the bootstrap? Default is FALSE. If FALSE, stan- dard errors will be calculated using the empirical variance of the efficient influ- ence function.
outcome_type	[character(1)] Outcome variable type (i.e., continuous, binomial, survival).
id	[character(1)] An optional column name containing cluster level identifiers.
bounds	[numeric(2)] An optional, ordered vector of the bounds for a continuous outcomes. If NULL, the bounds will be taken as the minimum and maximum of the observed data. Should be left as NULL if the outcome type is binary.

learners_outcom	ie
	[character] A vector of SuperLearner algorithms for estimation of the outcome regression. Default is "SL.glm", a main effects GLM.
learners_trt	[character] A vector of SuperLearner algorithms for estimation of the exposure mech- anism. Default is "SL.glm", a main effects GLM. <b>Only include candidate</b> <b>learners capable of binary classification</b> .
folds	[integer(1)] The number of folds to be used for cross-fitting.
weights	[numeric(nrow(data))] An optional vector containing sampling weights.
control	<pre>[list()] Output of lmtp_control().</pre>

### Details

### Should mtp = TRUE?:

A modified treatment policy (MTP) is an intervention that depends on the natural value of the exposure (the value that the treatment would have taken under no intervention). This differs from other causal effects, such as the average treatment effect (ATE), where an exposure would be increased (or decreased) deterministically. **If your intervention of interest adds, subtracts, or multiplies the observed treatment values by some amount, use mtp = TRUE**.

### Value

A list of class 1mtp containing the following components:

estimator	The estimator used, in this case "TMLE".	
theta	The estimated population LMTP effect.	
standard_error	The estimated standard error of the LMTP effect.	
low	Lower bound of the 95% confidence interval of the LMTP effect.	
high	Upper bound of the 95% confidence interval of the LMTP effect.	
eif	The estimated, un-centered, influence function of the estimate, NULL if boot = TRUE.	
shift	The shift function specifying the treatment policy of interest.	
outcome_reg	An n x Tau + 1 matrix of outcome regression predictions. The mean of the first column is used for calculating theta.	
density_ratios	An n x Tau matrix of the estimated, non-cumulative, density ratios.	
fits_m	A list the same length as folds, containing the fits at each time-point for each fold for the outcome regression.	
fits_r	A list the same length as folds, containing the fits at each time-point for each fold of density ratio estimation.	
outcome_type	The outcome variable type.

```

multivariate\_data Simulated Multivariate Exposure Data

### Description

A dataset with a continuous outcome, three baseline covariates, and two treatment variables.

### Usage

multivariate\_data

### Format

A data frame with 2000 rows and 6 variables:

C1 Continuous baseline variable.

C2 Continuous baseline variable.

C3 Continuous baseline variable.

D1 Treatment variable one at baseline.

D2 Treatment variable two at baseline.

Y Continuous outcome

sim\_cens

Simulated Longitudinal Data With Censoring

### Description

A dataset with a binary outcome, two time varying treatment nodes, two time varying covariates, and two censoring indicators.

#### Usage

sim\_cens

### sim\_point\_surv

### Format

A data frame with 1000 rows and 10 variables:

- L1 Time varying covariate time 1
- A1 Treatment node at time 1, effected by L\_1
- C1 Censoring indicator that the observation is observed after time 1
- L2 Time varying covariate at time 2, effected by L\_1 and A\_1
- A2 Treatment node at time 2, effected by L\_2 and A\_1
- C2 Censoring indicator that the observation is observed after time 2
- Y Binary outcome at time 3, effected by L\_2 and A\_2

sim\_point\_surv Simulated Point-treatment Survival Data

### Description

A dataset with a time-to-event outcome, two baseline nodes, a binary point treatment, six past-time outcome nodes, and six censoring indicators.

### Usage

sim\_point\_surv

### Format

A data frame with 2000 rows and 16 variables:

- W1 Binary baseline variable.
- W2 Categorical baseline variable.
- trt Binary treatment variable.
- C.0 Censoring indicator that the observation is observed future time points.
- **Y.1** Outcome node at time 1.
- C.1 Censoring indicator that the observation is observed future time points.
- Y.2 Outcome node at time 2.
- C.2 Censoring indicator that the observation is observed future time points.
- Y.3 Outcome node at time 3.
- C.3 Censoring indicator that the observation is observed future time points.
- **Y.4** Outcome node at time 4.
- C.4 Censoring indicator that the observation is observed future time points.
- **Y.5** Outcome node at time 5.
- C.5 Censoring indicator that the observation is observed future time points.
- Y.6 Final outcome node.

sim\_t4

### Description

A dataset with a binary outcome, four time varying treatment nodes, and four time varying covariates.

### Usage

sim\_t4

### Format

A data frame with 5000 rows and 10 variables:

- **ID** observation ID
- L\_1 Time varying covariate time 1
- A\_1 Treatment node at time 1, effected by L\_1
- L\_2 Time varying covariate time 1, effected by L\_1 and A\_1
- A\_2 Treatment node at time 2, effected by L\_2 and A\_1
- L\_3 Time varying covariate time 1, effected by L\_2 and A\_2
- A\_3 Treatment node at time 3, effected by L\_3 and A\_2
- L\_4 Time varying covariate time 1, effected by L\_3 and A\_3
- A\_4 Treatment node at time 3, effected by L\_4 and A\_3
- Y Binary outcome at time 5, effected by L\_4 and A\_4

sim\_timevary\_surv Simulated Time-varying Survival Data

#### Description

A dataset with a time-to-event outcome, one baseline nodes, two time-varying covariates, a binary time-varying treatment, two outcome nodes, and two censoring indicators. Data-generating mechanism taken from Lendle, Schwab, Petersen, and van der Laan (https://www.jstatsoft.org/article/view/v081i01).

#### Usage

sim\_timevary\_surv

### Format

A data frame with 500 rows and 11 variables:

L0.a Continuous baseline variable.

L0.b Time varying covariate at baseline.

L0.c Time varying covariate at baseline.

A0 Treatment variable at baseline

C0 Censoring indicator that the observation is observed future time points.

**L1.a** Time varying covariate at time 1.

L1.b Time varying covariate at time 1.

Y1 Outcome node at time 1.

A1 Treatment variable at time 1.

C1 Censoring indicator that the observation is observed future time points.

Y2 Final outcome node.

static\_binary\_off Turn All Treatment Nodes Off

### Description

A pre-packaged shift function for use with provided estimators when the exposure is binary. Used to estimate the population intervention effect when all treatment variables are set to 0.

### Usage

```
static_binary_off(data, trt)
```

### Arguments

data	A dataframe containing the treatment variables.
trt	The name of the current treatment variable.

#### Value

A dataframe with all treatment nodes set to 0.

### See Also

lmtp\_tmle(), lmtp\_sdr(), lmtp\_sub(), lmtp\_ipw()

### Examples

static\_binary\_on Turn All Treatment Nodes On

### Description

A pre-packaged shift function for use with provided estimators when the exposure is binary. Used to estimate the population intervention effect when all treatment variables are set to 1.

### Usage

static\_binary\_on(data, trt)

### Arguments

data	A dataframe containing the treatment variables.
trt	The name of the current treatment variable.

### Value

A dataframe with all treatment nodes set to 1.

### See Also

lmtp\_tmle(), lmtp\_sdr(), lmtp\_sub(), lmtp\_ipw()

#### Examples

tidy.lmtp

### Description

Tidy a(n) lmtp object

### Usage

## S3 method for class 'lmtp'
tidy(x, ...)

### Arguments

Х	A lmtp object produced by a call to lmtp_tmle(), lmtp_sdr(), lmtp_sub(),
	<pre>or lmtp_ipw().</pre>
	Unused, included for generic consistency only.

### Examples

```
a <- c("A1", "A2")
nodes <- list(c("L1"), c("L2"))
cens <- c("C1", "C2")
y <- "Y"
fit <- lmtp_tmle(sim_cens, a, y, time_vary = nodes, cens = cens, shift = NULL, folds = 2)
tidy(fit)</pre>
```

tidy.lmtp\_survival Tidy a(n) lmtp\_survival object

### Description

Tidy a(n) lmtp\_survival object

### Usage

```
## S3 method for class 'lmtp_survival'
tidy(x, ...)
```

### Arguments

х	A lmtp_survival object produced by a call to lmtp_survival().
	Unused, included for generic consistency only.

### Examples

```
# Time-to-event analysis with a binary time-invariant exposure. Interested in
# the effect of treatment being given to all observations on the cumulative
# incidence of the outcome.
A <- "trt"
Y <- paste0("Y.", 1:6)
C <- paste0("C.", 0:5)
W <- c("W1", "W2")</pre>
```
